
Purpose
This guidance provides practical steps and tools to mitigate the risk of GBV in UNICEF’s emergency preparedness planning and response and is intended as a reference guide for Emergency Specialists, non-GBV programme sections and Sector Specialists, and Senior Management. The current guidance incorporates specific GBV considerations, guidance and tools developed in response to the COVID-19 pandemic.

UNICEF’s Commitment to GBViE
Responding to GBV needs in emergency preparedness planning and response is one of the entry points to deliver on UNICEF’s commitment to address GBV in emergencies which is further reaffirmed in the Core Commitments for Children. Through these, UNICEF is committed to ensuring that gender equality is integrated consistently in its disaster prevention, humanitarian response and recovery programmes. The underlying principles is that gender analysis informs decisions based on the different needs and capacities of girls, boys, women and men.

Responding to GBV in emergencies further contributes to meeting UNICEF commitments to promoting Accountability to Affected Population (AAP) with its operational partners, within Humanitarian Country Teams (HCT), UNICEF COs and among Cluster members. UNICEF has a strong corporate commitment to accountability and specifically to children and their communities. Consistent with UNICEF’s mission and mandate, Core Commitments to Children (CCCs), and Humanitarian Principles, UNICEF subscribes to the revised IASC AAP and PSEA commitments to leadership, participation and partnership, information, feedback and action, and results in all aspects of its policies, operational guidelines and programmes.

Protection from Sexual Exploitation and Abuse (PSEA) is an agency-wide responsibility requiring action from management, operations, human resources and programme sections amongst others. UNICEF is a leading contributor to the IASC and UN coordination groups working on PSEA, bringing its GBViE expertise to these initiatives. All sectors have a critical role to play in designing and implementing their interventions in a way that minimizes SEA risks and helps connect survivors of SEA and other forms of GBV to appropriate care (you can find more on Tips for strengthening protection against sexual exploitation and abuse through UNICEF programming).

Taking Action on GBViE: UNICEF’s Approach
UNICEF’s vision is that girls and women affected by emergencies are able to fulfil their rights to live free from GBV. Three outcomes are linked to the realization of this vision, each of which forms an integral aspect of UNICEF’s GBViE programming in practice:

- Outcome 1. Support survivors with access to a comprehensive set of services;
- Outcome 2. Mitigate the risk of GBV across humanitarian sectors; and
- Outcome 3. Prevent GBV by addressing its underlying conditions and drivers.

In May 2019, UNICEF ED Fore announced the following GBViE commitments:

1. Increase the visibility of GBV in UNICEF-led clusters' Humanitarian Needs Overviews (HNOs) and Humanitarian Response Plans (HRPs): at least 10 HNO/HRPs for 2020 include GBV risk analysis and risk mitigation measures across all UNICEF-led clusters.
2. Increase the visibility of GBV in UNICEF's Humanitarian Appeals for Children (HAC): 50% of HACs to include GBV by 2020; 100% by 2021.
3. Strengthen UNICEF's internal systems for tracking the support provided to local women's civil society groups.

In June 2020, ED Fore announced all 130 UNICEF Country Offices will include GBViE in the Covid-19 response.

---

1 This note has been drafted by UNICEF GBViE Specialists from HQ, MENARO, and ESARO in consultation with Emergency Preparedness Focal Points and with considerations for the Emergency Preparedness process.
These outcomes are supported by an ongoing and simultaneous effort to coordinate with the humanitarian community and with governments, civil society and non-governmental organizations (NGOs) on systems strengthening.

Key resources: UNICEF GBViE Operational Guide and UNICEF GBViE Programme Resource Pack

What is GBV risk mitigation?
Integrating GBV risk mitigation promotes better, safer programming for all. The goal of GBV risk mitigation is to make humanitarian systems and services safe, effective and responsive to the needs and rights of women and girls. Concretely, this means ensuring humanitarian service delivery:

1. does not increase the likelihood of GBV occurring by creating additional or exacerbating existing GBV risks;
2. seeks to identify and mitigate GBV risks;
3. conducts ongoing monitoring of access and barriers to services, particularly those faced by women and girls; and
4. are equipped to safely and ethically refer survivors of GBV using available GBV referral mechanisms or know what to do in areas where there is not referral mechanism and are familiar with the GBV Pocket Guide.

GBV risks are factors that increase the likelihood of GBV occurring. GBV risks contribute to – but are not the same as – incidents of GBV or forms of GBV (such as sexual violence or intimate partner violence). The figure below provides examples of GBV risks at individual/family, community and societal levels.

GBV risk mitigation interventions are actions taken to reduce identified risks. An example is provided below:

- GBV risk: The route to a nutrition center passes through an area occupied by armed groups/checkpoints.
- Implications: Women and children have difficulty accessing services, due to fear and/or experience of assault and harassment.
- GBV risk mitigation intervention: In some settings, it may be possible to move the facility to a safer location. In others, nutrition actors can set up mobile outreach modalities that provide services closer to target communities and minimize the need for service users to travel on unsafe routes.

Key messages: GBV and emergency preparedness

1. Gender-based violence (GBV) is a life-threatening human rights, public health and development issue that affects every aspect of women and girls’ life and wellbeing. GBV is the pervasive yet least visible human rights violation in the world. Gender inequalities and harmful practices/social norms are the causes and contributing factors of GBV. Although GBV affects everyone, at least one in three females – over one billion worldwide – will experience physical and/or sexual violence in their lifetime, simply because they are female.

2. Women and girls are disproportionately affected by conflict, natural disasters and public health emergencies. For example, women, girls and boys are 14 times more likely to die in a natural disaster compared with their adult male counterparts. Natural disasters and climate-induced threats erode women and girls’ resilience and access to and control of natural resources. Evidence shows that women and girls bear the burden of public health emergencies, such as Ebola, COVID-19 and cholera, and their risks for GBV, including sexual exploitation and abuse, increase dramatically.

3. Integrating GBV risk mitigation measures is not only a core responsibility of all humanitarian actors (Centrality of Protection, Accountability to Affected Populations, Core Commitments for Children etc.) it also improves the safety and well-being of people most affected by crisis across all sectors. By preparing for and delivering aid and services in the safest and most dignified way, access improves, and more people benefit thereby strengthening overall outcomes. On the other hand, failing to address gender-based violence concerns compromise the effectiveness of emergency preparedness and
humanitarian response across all sectors. In some country the cost is up to 3.7% of GDP which is DOUBLE the cost of an education budget. Research indicates that the direct and indirect costs of GBV could be as large as 2 per cent of global gross domestic product.

4. Preparing for and addressing gender-based violence in emergencies will not only secure the rights, protection and wellbeing of millions of girls and women caught in the midst and aftermath of an emergency, it will also improve prospects for peace, equality and progress toward sustainable development thus increasing UNICEF’s contribution towards SDG Goal 5: Achieve gender equality and empower all women and girls, Goal 16: promote peaceful and inclusive societies for sustainable development as well as Goals 1, 3 and 4.

5. With our demonstrated technical expertise, leadership and operational capabilities across multiple sectors, UNICEF has a unique institutional capacity to prepare for and deliver high-quality, multifaceted GBV in emergencies programming.
Entry Points and Key Actions to Integrate GBV in Emergency Preparedness Planning

**Risk analysis and monitoring**
- Identify and articulate (1) existing knowledge about GBV risks, barriers to services and specific needs of women and girls and (2) GBV risks and barriers to services from previous or similar emergencies.
- Reflect these considerations into risk severity ranking.

**Scenario definition**
- Critical GBV risks for women and girls are considered and included in each scenario.

**UNICEF response planning and implementation**
- Develop a response plan that explicitly and proactively responds to GBV risks for women and girls in alignment with UNICEF's commitments, UNICEF's GBViE Operational Guide and global/national standards.

**Preparedness actions**
- Ensure MPS on training, staff & surge, supply and logistics, cash and partnership include specific actions on GBV risk mitigation.
- Meaningfully include women and girls in consultations on preparedness actions and implications for response.

**Monitoring and reporting**
- Measure GBViE commitments in EPPs and contribute results to HAC targets (where relevant).
- Monitor GBV risk mitigation actions in preparedness actions and emergency response.
### Key GBViE Integration Actions in UNICEF’s Emergency Preparedness and Response

and (4) identify criteria to assess and monitor the risk of an emergency.

**COVID-19 Specific Considerations:**
In situations where community consultations cannot take place due to quarantine/lockdown policies, the AAAQ framework can act as a starting point to think through potential barriers that women, girls and other at-risk populations are likely to face.

**Important:**
DON’T ask questions about individuals’/specific people’s experiences of GBV.
DON’T collect or attempt to collect GBV incident data/numbers of cases.
DON’T attempt to convene a consultation group comprised only of GBV survivors or to find GBV survivors to take part in the consultations.
DON’T make questions too general.
Refer to the tip sheet for more information for Do’s and Don’ts.

2 Refer to ED Fore Commitment # 3
Consultations with women and girls are key commitments in the IASC AAP commitments, CCCs and IASC Common Framework for Preparedness. The involvement of women and girls is essential to the analysis, design, implementation and monitoring of emergency preparedness and response actions. Entry points are detailed in the table below.

Guidance on consulting with women and girls:
1. Consult with women and girls on their concerns, specific needs, movement and daily responsibilities. Work with community leaders to ensure women’s participation.
2. Be aware of barriers to participation including gender roles; absence in decision making roles; perceptions that women are vulnerable versus capable; limited participation and interaction in the public sphere due to domestic/unpaid labor; women and girls not recognized as frontline responders.
3. Be aware of how women and girls are consulted. Consult women and girls separately, including separate spaces for adult women, younger women, adolescent girls and so on. Be mindful of power relationship and do not assume male community leaders or members know what women, girls, boys or other groups want. Use existing services, such as mother to mother groups in nutrition centers or women and girl safe spaces to engage safely.
4. Create a safe space for consultations by (i) ensuring facilitators and teams are gender balanced, diverse and are trained; (ii) explaining to women and girls how information will be used and ask for their informed consent; iii) ensure that the consultation venue is safe, private and accessible; iv) ensure confidentiality of information shared.

GBV Risk mitigation: All sections
2. UNICEF GBViE Core Community Awareness Messages: Covid-19 Response

---

3 IASC AAP commitments: a) Participation: Promote equitable, two-way communications between communities and aid providers. This implies engaging communities in planning & M&E processes, starting with country program development to programme implementation and monitoring.
   b) Feed-back and complaints mechanisms: COs must ensure that vulnerable, at-risk and affected people and other stakeholders (such as local first line responders) have safe, equitable and appropriate means to provide feedback and complaints about their experiences and perspectives on the design, quality and effectiveness of responses, and integrate their feedback into decision-making processes related to planning and course correction.
4 CCCs: Promoting the participation of children, adolescents, women and affected populations, including in the analysis, design and monitoring of humanitarian programmes.
5 IASC Common Framework for Preparedness: Preparedness aims to reduce vulnerability and enhance resilience and protection by applying a human rights-based approach, including through consultation with the affected population.
Cheat Sheet #1: How to Integrate GBV into Secondary Data Review (SDR)

In the Secondary Data Review across sectors, it is important to identify GBV risks and barriers that women, girls and other at-risk group face as a result of the expected emergency so that appropriate GBV risk mitigation measures can be taken at both the preparedness and the emergency response. The SDR is a basis of the Risk Analysis and the Scenario Definition. If there is an information gap, consider conducting assessments and research to fill the gap. The SDR can be updated regularly as more information comes especially where an ongoing emergency is happening.

Cheat Sheet #2: Scenarios and Potential GBV Risks and Barriers for Women and Girls

Women and girls face specific GBV risks and barriers to engage in emergency preparedness activities leading to a response that does not fit their unique needs and may cause more harm.

- Examples of GBV risks and barriers experienced by women and girls when engaging in emergency preparedness activities
  - Barriers to participation in community preparedness mechanisms, such as early warning systems or early warning notifications.
  - Mobility restrictions or literacy barriers to participate in community-based risk assessments or early warning systems.
  - Risk of violence in the home as a consequence of participation in “public” parts of life (e.g. social and cultural expectations on women and girls mixing with men outside the family and other strangers).

- Sample GBV risks and barriers of women and girls at the onset and aftermath of an emergency
  - Women and girls are more likely to die in a natural disaster because do not have information, are less mobile (carrying children/other dependents), do not know where the evacuation centers are because they are not included in preparedness planning or notification systems do not fit their needs.
  - Poorly designed services, evacuation centers, shelters, sanitation facilities etc. that do not fit the privacy, safety and acceptability needs of women and girls.
  - Unsafe services due to their design, transfer modality for cash and vouchers, distance/route or other factor(s).

</tbody>
</table>

Potential GBV risks, including SEA, associated with different emergency scenarios

Conflict, disasters and disease-outbreak including epidemic and pandemic infectious diseases such as cholera, ebola, covid etc can exacerbate risks and exposure to gender-based violence particularly for women and girls during emergencies, which may include the following:

- Break down family and community support mechanisms, destroys homes and basic livelihoods which women and girls have primary responsibility for their safety and wellbeing;
- Increased stress, insecurity, engagement in hazardous and negative coping mechanisms among women and girls due to loss of livelihood and pre-existing protective mechanisms.
- Increased in militarization of communities, attacks and violence against women and girls.
- Forced displacement, migration conscription, abduction, recruitment into armed groups and trafficking of women and girls;
- Women and girl may experience increased risks of protection during including separation when emergencies hit given their gender responsibilities for caring for others.
- Women and girls taking dangerous and unsafe route to flee, sheltering in deplorable living conditions in order to survive;
- Exacerbation of pre-existing gender inequality against women and girls thereby further depriving their rights to decide and access to information and services during emergencies.
- Poor and unsafe design of facilities and services due to lack of women and voices in them.
- Imposed infection prevention and control measures including lockdown and other social distancing that do not take into consideration safety and wellbeing needs for women and girls.
- Loss of livelihood and access to basic needs impacting survival.
- Disruption of pre-existing access to information, access to available services and service provision arrangements.
- De-prioritization of protection and care for vulnerable populations and survivors of gender-based violence during public health emergency response including suspension of existing support services, and or requisition of women and girls’ spaces to respond to different outbreaks.
- Individuals who were traditionally marginalized tend to be harmed by conflict, disaster, and disease-outbreak more than individuals who were in positions of relative privilege beforehand.
- After disasters, it takes women longer and more difficult to find and prepare food, and care for other family members including children (particularly if schools are ruined or closed) and this may increase exposure to intimate partner violence (IPV);
- Reduced access to sexual and reproductive health information and services during disease outbreak can lead to increased risky behavior, increased obstacles to reporting incidents of sexual violence and seeking care.

**Implications for UNICEF Programmes and Operations**

| WASH | Lack of safe WASH facilities and services: | lack of latrines for example can promote open defecation. Women and girls may even delay eating on time just to avoid open defecation. They may also prefer to wait for the dark to fall in order to use the bush due to taboos open defecation. Due to certain social norms, women and girls may wait to use existing latrines after dark. Women, girls and sometimes boys may have to walk long distances to collect water or to find water do their laundry. At times they must walk to remote locations. They may even use unsafe routes including passing through heavily militarized terrains to avail WASH facilities or services. Women and girls in reproductive age may not participate in group activities because they cannot afford dignity/hygiene supplies.

- Poor designed WASH facilities/services: women and girls may not be consulted. WASH facilities/services may be designed insensitive to the gender dynamics of a given society or cultural context.

- Inadequate WASH Facilities/services: Lack of access to water for example may contribute to tension and domestic violence among community members particularly in water-scarce or drought-affected areas. Queuing for extended periods to access water can lead to increase exposure to domestic violence but also fights among community members. The lack of limited WASH facilities including water points, latrines and showers may also create tension among women and men on the usage. This may force women and girls to avail alternates even if this is unsafe.

- Lack of women and girls’ participation in WASH programming: men providing WASH services may be potential perpetrators of GBV and SEA.

| Nutrition | Existing gender inequalities and social norms: | social norms/cultural practices may impede women and girls from making decisions about what to eat and when. During displacement resulting from conflict or natural disaster, food may be lacking or scare. And where food is available, often it is men who decide on what to eat which has significant impact on pregnant and lactating women. Men may trade family food for personal reasons. Wherein child marriage or polygamy are practiced, adolescent girls or women with special needs may have increased barriers accessing food on time. In addition, barriers for women to own land may also limit their access to food.

- The Lack of basic needs including food may push women and adolescent girls to engage in survival sex.

- Design of nutrition facilities and services: locations wherein nutrition facilities are located or the time for providing nutrition services may put women and girls at risk.

- Behavior and attitude of nutrition personnel: during emergencies, personnel are often recruited quickly to life-saving intervention. If not trained on protection, this may increase potential for sexual exploitation and abuse.
| **Education** | **Lack of learning spaces**: existing learning spaces may be ruined by conflict or disaster. Fighting forces may even occupy learning spaces. Lack of learning spaces means children will have to stay at home; and girls particularly may be married off. Lack of learning spaces also mean children will have to walk long distances to access locations where they can find learning spaces.  
**Loss of legal documents**: during emergencies, children may lose their legal documentation including school documents. This may affect them accessing education services in displaced settings.  
**Language barriers**: language barrier may also deprive children from accessing education services in some displaced settings.  
**Poor designed of Education facilities/services**: Education facilities and services may be designed without community inputs thus increasing safety risks for children, particularly girls.  
**Limited basic needs**: the loss of livelihoods, family and community support network can make life difficult for adolescent girls. In many cases, they may not be able to meet their needs of clothing, shoes, cream etc to go to school. This may in turn increase their vulnerability to sexual abuse. |
| **Health** | **Inadequate/lack of healthcare services**: healthcare is a priority and life-saving intervention. Unfortunately, when emergencies hit healthcare services are disrupted. In search of healthcare services, affected communities often walk long distances to avail healthcare services. Wherein humanitarian assistance is not available, fees or in-kind payment may be required to avail healthcare services. Individuals experiencing sexual violence prior or during emergencies may not find medical care. |
| **Child Protection** | **Increased protection needs**: increased separation, child labor, survival sex etc. Separated or unaccompanied children may find themselves with people they do not know. Individuals working in emergencies may be potential child abusers. Children may face increased challenges meeting their daily needs which might further exposes them to abuse or negative coping mechanisms. |
| **C4D** | **Limited access to accurate information and available services**: during conflict or disaster, the existing mechanisms for accessing information about basic services may be erupted and this can lead to further victimization and negative coping mechanism. It is therefore critical for C4D to collaborate with all sectors about the best and appropriate ways of increasing access to life-saving information during emergencies through community risk mitigation and community engagement (RCCE) efforts. |
| **Programme Monitoring Units** | **Lack of evidence on GBV risks and needs for informed programming**: emergencies programming may be developed with urgency without taking into consideration risks factors and protection needs for women and girls. Where data is available, often it is not disaggregated by gender and age. This oversight may result to exacerbating risks which will eventually impact UNICEF’s capacity to deliver on its global commitments on CCC including GBViE (e.g. HAC). |
## Key Priorities and Actions for Response

<table>
<thead>
<tr>
<th>Phase</th>
<th>GBV prevention and response actions</th>
<th>GBV risk mitigation actions</th>
</tr>
</thead>
</table>
| **Preparation** | In consultation with relevant partners and community structures including local women’s groups/organizations, identify GBV risks and plan to address them  
Have a documented plan for response  
Identify key potential actors including local women groups/organizations for response  
Access and build capacity of local women groups/organizations on programmatic and governance structures (e.g. HACT)  
Have deployable roster with all pre-approvals  
Build capacity of first responders on GBViE including PSEA | In consultation with GBV specialist (GBV AoR), relevant partners and community structures including local women’s groups/organizations, identify GBV risks for sections and plan to address them  
Have a documented plan for response  
Identify Focal Points in sections to lead and support GBV risk mitigation actions  
Collaborate with Child Protection Section/GBV Specialist to raise awareness in the section and train Sections’ Focal Points on GBV Risk Mitigation |
| **Resource mobilization** | Based on needs identified, ensure GBViE (including response to SEA) actions are costed and included in the contingency plans, proposals and PDs  
Partner with relevant actors including local women’s group/organizations  
Procure and preposition essential supplies including CMR and tents for setting up emergency response spaces as necessary  
Translate and or print all necessary GBV tools including case management forms | Work with GBV specialists, Child Protection or Gender Sections to ensure GBV risk mitigations (including SEA risk mitigation) are included in the sections’ contingency plans, proposals, and PDs  
Ensure sectors’ proposals, PCAs and PDs reflect GBV risk mitigation actions based on the GBViE needs and gaps  
Procure and preposition relevant GBV risk mitigation supplies including dignity kits, lights etc |

### Key resource:
- GBViE Donors Cheat Chart – August 2019
- CO Resource Mobilization Template

| Implementation | Map out available clinical services for sexual violence and identify/fill gaps in coverage, supplies and staff capacity  
Collaborate with other partners and agencies including UNFPA to build capacity on CMR and GBV case management  
Provide psychosocial support services, including GBV case management.  
Identify locally appropriate safety options for survivors facing ongoing safety risks.  
Establish and/or support GBV referral pathways.  
Establish and or strengthen women and girls’ safe spaces.  
Distribute dignity kits.  
Adapt safety audit tools and integrate them into assessments and monitoring. | Train UNICEF staff and partners in all sectors on the IASC GBV Guidelines.  
Identify entry points within existing programming to implement recommended actions from the GBV Guidelines.  
Train UNICEF staff and partners in all sectors on how to safety and appropriately support survivors who choose to disclose their experience.  
Incorporate regular consultations with women and girls into programmatic monitoring across all sectors  
Support the distribution of dignity kits.  
Adapt safety audit tools and integrate them into assessments and monitoring. |
| Monitoring and Evaluation | Conduct community safety planning (safety audit) of sectors services, in consultation with women and girls.  
| C4D sector to integrate messages about available GBV services and referral pathways in their RCCE efforts |
| Include indicators in the contingency plans, proposals and PDs for tracking commitments on GBViE specialized programming:  
Ensure GBViE prevention and response indicators are reflected in the sectors plans and results monitoring framework  
Regularly collect and report on GBV prevention and response results from UNICEF supported interventions.  
Document best practices for future advocacy and programming |
| Include indicators in the contingency plans, proposals, and PDs for tracking commitments on GBV Risk mitigation programming:  
Ensure the indicator on GBV risk mitigation is reflected in the sectors plans and result monitoring framework  
Regularly collect and report on GBV risk mitigation results from UNICEF supported interventions  
Document best practices for future advocacy and programming |
| Coordination | As possible, participate in GBV coordination forums to learn about GBV needs and gaps as well implications for improving the sections results outcomes.  
Promote information dissemination about the available GBV services in the sections’ community engagement efforts. Where there are no GBV service providers, work with protection actors including child protection colleagues to support GBV survivors.  
Link GBV survivors with specialists (GBV/CP specialists)  
Strive for 50% of women in the decision-making bodies in preparedness and emergency response  
Include GBV risk mitigation is a standard agenda in the decision-making bodies.  
Ensure that there are linkages with local women’s groups and other at-risk groups like (for instance associations or community-based organizations working with people with disabilities).  
Where there are sector specific coordination structures, integrate GBV risk mitigation into the sector specific coordination structures, work plan and their preparedness plans.  
Donor engagement and funding – advocate funding for GBV risk mitigation, specific needs of women and girls and other at-risk groups. |
| Participate in GBV coordination forums  
Participate in other sectors’ coordination forums to raise awareness on GBV needs and gaps  
Support GBV service provision - ensure GBV response services are child-friendly and that they consider the needs of child survivors.  
Strengthen linkages between GBV and other service referral pathways  
Identify Focal Points in the section to support GBViE actions |
| GBV does not end when the emergency ends – new forms may emerge, therefore plan to continue working on GBV - ensure funding for this.  
Scale up GBV services for prevention and response including continuous capacity building based on lessons learnt  
Engage local women’s organization take part in the GBViE efforts: risk mitigation, prevention and response |
| GBV does not end when the emergency ends – new forms of GBV risks may emerge, therefore plan to continue working on GBV risk mitigation- ensure funding for this  
Scale up GBV risk mitigation efforts including continuous capacity building based on lessons learnt  
Engage local women’s organization take part in the GBViE efforts: risk mitigation |
Cheat Sheet #3: Monitoring and Reporting for GBV Risk Mitigation

Strategic Plan Indicator 3.a.6: Percentage of UNICEF-targeted women, girls and boys in humanitarian situations provided with risk mitigation, prevention or response interventions to address gender-based violence through UNICEF-supported programmes.

This indicator aggregates the number of girls, boys and women reached through UNICEF’s core GBViE interventions. The SP indicator is an aggregate of the following UNICEF GBViE Operational Guide monitoring framework indicators:

<table>
<thead>
<tr>
<th>Response Services for GBV survivors</th>
<th>GBV Risk Mitigation</th>
<th>GBV Prevention</th>
</tr>
</thead>
<tbody>
<tr>
<td>Outcome Indicator 1.2: # of survivors who receive GBV response services (disaggregated by sex and age)</td>
<td>Outcome Indicator 2.1: # of women, girls and boys in humanitarian situations benefiting from GBV risk mitigation implemented by UNICEF-supported sectors (disaggregated by age, sex and sector)</td>
<td>Output Indicator 3.2.b: # of women, men, girls and boys reached by social norm change interventions (disaggregated by sex and age)</td>
</tr>
<tr>
<td>Output Indicator 2.3.c: # of girls and women accessing safe spaces (disaggregated by age)</td>
<td>Output Indicator 2.3.a: # of adolescent girls and women who receive dignity kit/supplies supported by UNICEF (disaggregated by age)</td>
<td>Output Indicator 3.3.b: # of adolescent girls and women benefitting from asset-building interventions (disaggregated by age)</td>
</tr>
</tbody>
</table>

Sample indicators for HRP, HAC and partnership documents

<table>
<thead>
<tr>
<th>Thematic area</th>
<th>Sample indicators⁶</th>
</tr>
</thead>
</table>
| Frontline worker and staff composition | % of [sector e.g. WASH, nutrition, education, child protection, health, cash/social protection] staff and frontline workers who have received orientation on the GBV referral pathway and are able to refer survivors to appropriate care.  
% of [sector] staff who have signed a code of conduct.  
% of [sector] staff who are female. |
| Partnerships | % of implementing partners who are local/national women’s organizations. |
| Assessments and monitoring | % of sector assessments and monitoring reports that include a GBV risk and barrier analysis. |
| Safety audits | # of a safety audits/monitoring conducted jointly with GBV actors.  
# of locations where a safety audit/monitoring is conducted jointly with GBV actors.  
% of recommendations from the safety audit implemented. |
| Barriers to services (applicable to all programme sections) | % of women and girls reporting [type of service] is/are available.  
% of women and girls reporting [type of service] are available at convenient times.  
Average distance or time travelled to [facility/service/center etc.].  
Average waiting time at [facility/service/center etc.].  
% of women and girls who reported that their privacy was ensured at the [e.g. nutrition or health facility].  
% of women and girls who report comfort (or satisfaction) in using [type of service]. |
| Technical: WASH | % of latrines that meet the WASH sector/cluster minimum standards, including privacy and dignity.  
% of bathing facilities that meet the WASH sector/cluster minimum standards, including privacy and dignity.  
Proportion of female representatives in community-based WASH structures i.e. WASH COMs and Hygiene Committees. |

⁶ The following indicators are collated from current global guidance and various CO efforts to operationalize GBV risk mitigation, especially Nigeria and South Sudan.
